In this folder, I list some of my models through interdisciplinary research collaboration, I pick them either for the tricks that I use I like a lot, for example, using dynamic imputing to deal with missing data.
Or I like the process of how we formulate a social analysis/ nuclear physical analysis problem into a ML problem (eg: classification or regression) and pick the right model according to the type of the data

I have fun working on them and would love to share with you!
